

A unique outlook on technology

Crinia is an indigenous frog of Australia which has the remarkable ability to enlarge its throat to project loud and perfectly audible sound for such a small creature. Whilst we can not emulate nature's one billion years of evolution, we see it as an inspiration to develop innovative products which push the boundaries of technology.

The Crinia Premium Conference Phone System is undoubtedly the pinnacle of today's conference phone systems. This wireless telecommunications innovation combines cutting edge technologies with award winning design to prove that boardroom technology can be beautiful. Our clients have said, "You must see this phone in the flesh to appreciate the presence it gives an executive boardroom".

Base Station

The Base Station is the communication interface that provides power to the Tower and the Handset, and houses the removable USB Memory Key.

Handset

The interface is a touch screen telephone handset and remote control which manages all the system's functions and operations.

Tower

The wireless Tower has been engineered using the latest acoustic technology maximising audio input and output for optimum clarity and unparalleled sound performance.

Award Winning Design

The Crinia Conference Phone System has won the prestigious Industrial Design Excellence Award (IDEA) from the Industrial Designers Society of America (IDSA). This award is the benchmark for design excellence and reinforces the Crinia Conference Phone System as a technologically advanced and functional piece of office art.

Wireless Control

The system is controlled by a wireless handset with touch screen. The custom Graphic User Interface (GUI) is intuitive and easy to use. Allowing users to Dial/Answer calls, Store phone numbers in the directory, and Playback recordings all wirelessly from the handset. This handset can also be used as a phone, allowing users to initialise calls and with the touch of a button swap the call instantly to the conference tower.

Voice Recording

The Crinia Conference Phone System records up to 10 hours of dialogue on a removable USB Memory Key. This stored dialogue can be played back through the system or easily downloaded onto any computer and played back, emailed or archived.

Audio Quality Speakers

Using Acoustic Pillar Technology, this compact but powerful tower is optimised specifically to reproduce the sound of voices. Utilising a full range of treble and bass, without need for a secondary sub woofer.

Adaptive Echo Cancellation

The echo cancellation technology developed for the Crinia Conference Phone System delivers unprecedented sound quality. The intelligent System adapts to the acoustic environment eliminating echo, reverberation and background noise level.

Background Noise Reduction

The Crinia Conference Phone System's proprietary software adapts to the surrounding acoustic environment, eliminating echoes and reverberation, and focusing on the loudest speech signal.

Beam-forming Technology

The signals from four microphones are combined using multiple fixed beam-formers, each of which listens to sound arriving from different directions. The Crinia Conference Phone System automatically locks onto the direction of the loudest speech signal, resulting in lower background noise levels.
